

TAO 1tiny 4K Firmware Upgrade Guide(U disk)

1. Apply to:

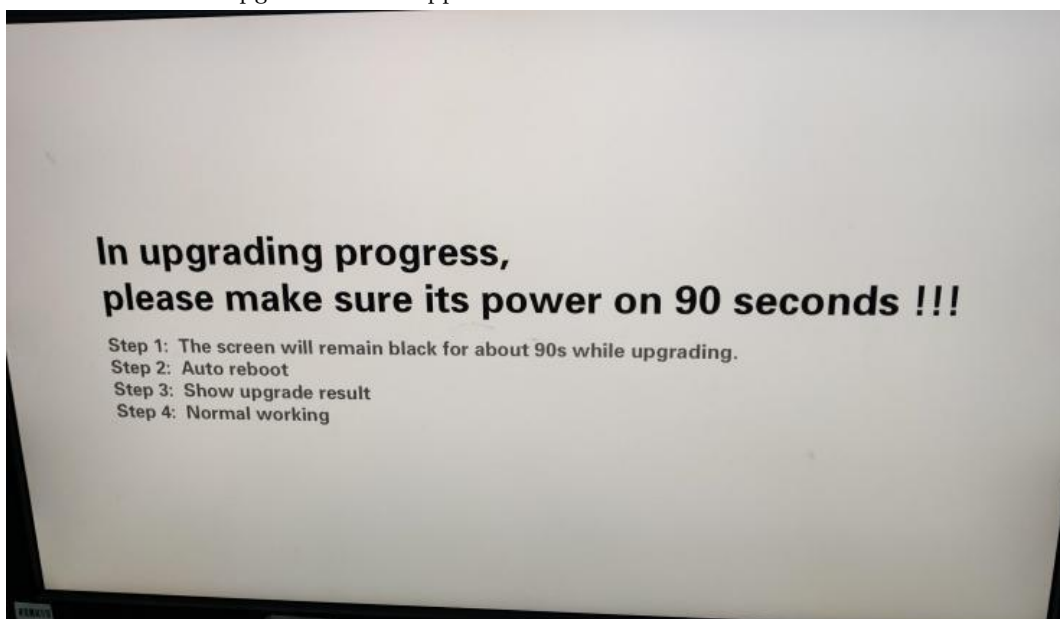

Upgrade TAO 1tiny 4K from previous version to V1.13.5.16 and above.

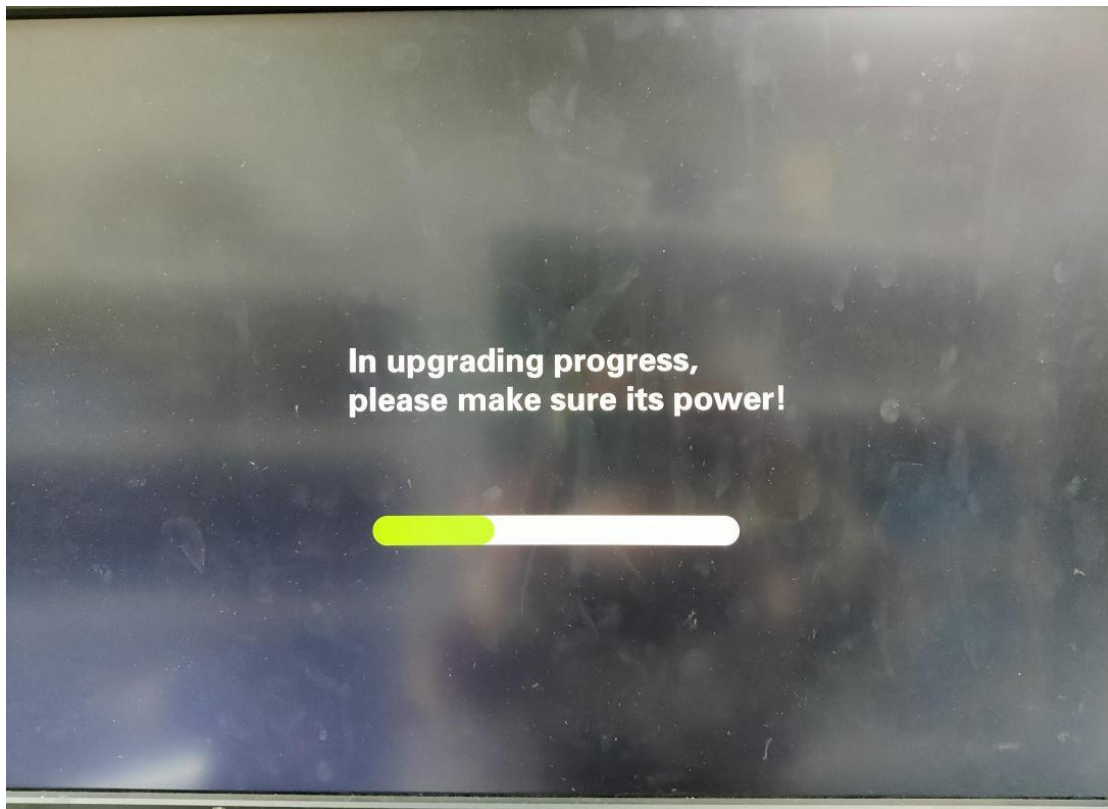

2. Upgrade steps:

- (1) Copy the upgrade file and put it in the root directory of the U disk(it is recommended not to put other files in the U disk, the upgrade time will increase if there are other files).

- (2) First power on the device, connect signal to the input and output to monitor, and then insert the U disk to the USB port, wait for about 10 seconds, and a prompt to start the upgrade will appear.

- (3) It takes about 1 and a half minutes to upgrade the system. During this process, try not to move the power cable to avoid interrupting the upgrade and causing the upgrade to fail; the screen will be black during the upgrade process, and the device will automatically restart after the upgrade is successful, displaying the boot logo and firmware version changes.

- (4) Afterwards, power on again will prompt the firmware version again, and it will stay for about 4 seconds.

Remarks: It will only be displayed if input and output are connected.

- (5) upgrade succeeded.
